HOW TO DETECT COUNTERFEIT CURRENCY

Going back to basics, this proven measure is a one control verification using only the embedded Security Thread which is visible in all $5, $10, $20, $50 and $100 bills. The Security Thread is very difficult to duplicate and although visible to the naked eye, it can be easily verified using a UV pen light. With a UV light the Security Thread glows and clearly shows the denomination of the bill for added validation (it can identify bleached or washed bills).

STEP 1: Look for the Security Thread in all $20, $50 and $100 bills. Use a UV light pen to verify the denomination of the bill (i.e. $20 will say USA TWENTY).

STEP 2: If the bill is believed to be suspect notify the person in charge and return the bill to the customer asking for another form of payment (never assume the customer knows the bill is counterfeit or accuse them of passing a counterfeit bill).
